# I. Introduction

HECTOR column is designed for HPLC, LC-MS, SFC, and SMB. HECTOR columns are manufactured under the most stringently controlled conditions, guaranteeing constant particles and pore distribution as well as a constant size and pore volume and low metal impurity. HECTOR columns are well end-capped for reproducibility and durability. Therefore, HECTOR columns, which have a lower concentration of free silanols, affect the retention time and peak shapes of basic solutes. We offer a full line of phases, including HECTOR-M, A, T, W, and ACD, to provide our customers with a wide range of selectivity.

HECTOR columns are based on 3, 5, and 10  $\mu\text{m}$  particles with high-purity silica. We provide various lengths and inside diameters. These columns have a superb performance for a variety of applications in the pharmaceutical, chemical, environmental, and food separation areas.

## Advantages of HECTOR Columns

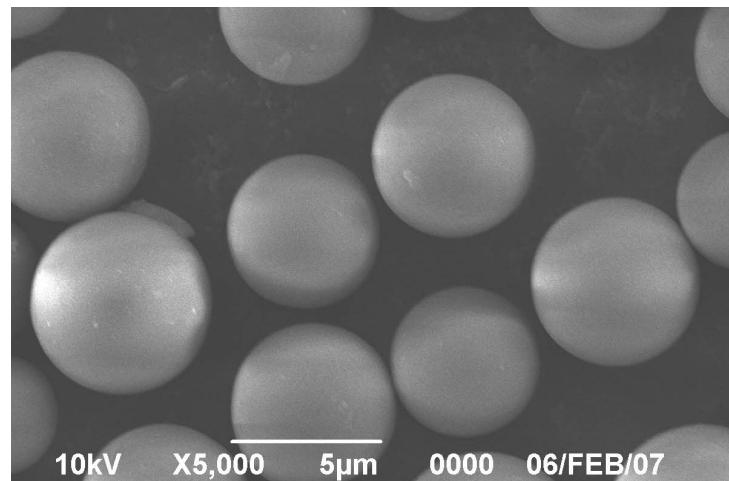

- High-purity silica
- Fully end-capped for reduced peak tailing
- Excellent peak shape for acids, bases, and neutrals
- High reproducibility
- Improved resolution
- Available in various pore and particle sizes
- Reproducible manufacturing practices for reproducible column-to-column performance
- Easy to scale up
- Eliminates the silanol effect for a good peak shape

## 1-1) Bare Silica Information

### Silica Distribution & Shape

SEM picture of bare silica

5 µm Bare Silica

HECTOR columns provide a silica material with  $\text{SiO}_2 > 99.99\%$  purity, which points to a total metal content of <100 ppm.

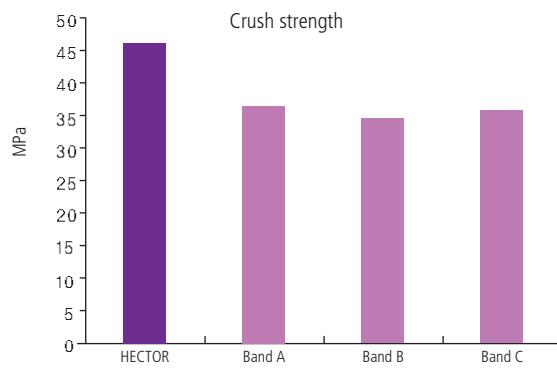

- Most lot data show less than 10 ppm
- Selection of particle sizes to optimize the efficiency
- Spherical particle shape to reduce the pressure
- Consistent and reproducible retention times to allow direct scale-up from the laboratory through the process applications
- Lot-to-lot consistency for reproducible performance
- Bulk quantities for larger-scale applications available, secured lots offered for process use

### Specifications of Silica

	Unit	Specification
Particle size	µm	3,5,10
Surface area	m <sup>2</sup> /g	320
Pore volume	ml/g	0.70-0.90
Particle size distribution d <sub>10</sub> /d <sub>90</sub>	µm	1.55 Max
Na	ppm	< 10 Max
Mg	ppm	< 10 Max
Al	ppm	< 10 Max
Ca	ppm	< 10 Max
Fe	ppm	< 10 Max
Zr	ppm	< 10 Max
Ti	ppm	< 10 Max

## Mechanical & Chemical Stability

## Particle size distribution

The narrow distribution of HECTOR columns permits their utilization for a broad range of applications, allowing optimization of selectivity and capacity. The tight particle size distributions for the 3 and 5 μm particles are ideal for choosing the best compromise between efficiency, operating pressure, and process time, thus offering the best balance between price and performance.

## 1-2) Column Line-up

### A) HECTOR-M: First choice, Wide range application

HECTOR-M columns are well end-capped for reproducibility and durability. Their wide range of stationary phases supports the customer demands, from the analytical to the semi-prep scales. For the reversed-phase mode, the C18, C8, C4, NH<sub>2</sub>, CN, and phenyl phases are available, depending on the polarity. On the other hand, Sil, NH<sub>2</sub>, and Diol are available for the normal-phase mode. These normal-phase columns separate acidic, neutral, and basic compounds through the right choice of stationary phase.

- Differentiated Phases: C18, C8, C4, NH<sub>2</sub>, Diol, CN, Phenyl, Sil
- Specifications: Spherical silica, monomerically bonded, endcapped, 100 Å pore size
- Format: Analytical, Semi-prep

#### HECTOR-M : Wide range application

Phase	Description	Base	Particle size (μm)	Pore Size (Å)	Surface Area(m <sup>2</sup> /g)	Carbon Load(%)	Phase Type	End-capping	USP
C18	ODS-bonded phase that used reversed phase.	Silica	3,5,10	100	320	17	monomeric	Yes	L01
C8	When C18 is too retentive. It has lower C% than C18.	Silica	3,5,10	100	320	10	monomeric	Yes	L07
C4		Silica	3,5,10	100	320	3-4	monomeric	Yes	L26
NH <sub>2</sub>	Polar phase that can be used normal and ion exchange mode	Silica	3,5,10	100	320	4	monomeric	Yes	L08
Diol	Alcoholic hydroxyl, mild adsorption, neutral charge.	Silica	3,5,10	100	320	4	monomeric	Yes	L20
CN	Stable, long-life, cyano phase	Silica	3,5,10	100	320	6-7	monomeric	Yes	L10
Phenyl	Nonpolar. hydrophobic retention of a phenyl phase is similar to that of a C8 bonded phase, but unique selectivity	Silica	3,5,10	100	320	10	monomeric	Yes	L11
Sil	For general purpose normal-phase application	Silica	3,5,10	100	320	-	-	-	L03

## B) HECTOR-A: Usable under 100% aqueous condition

By introducing a hydrophilic functional group to the C18 and C8 stationary phases, HECTOR-A is able to use below 100 % aqueous conditions without collapsing the carbon chains. The HECTOR-A stationary-phase provides alternative selectivity with a longer retention of polar compounds.

- Differentiated Phases: C18, C8
- Specifications: Spherical silica, monomerically bonded, endcapped, 100 Å pore size
- Format: Analytical, Semi-prep

HECTOR-A : Compatible with 100 % aqueous mobile phase

Phase	Description	Base	Particle size (µm)	Pore Size (Å)	Surface Area(m <sup>2</sup> /g)	Carbon Load(%)	Phase Type	End-capping	USP
C18	C18 bonded silica with hydrophilic functional group	Silica	3,5,10	100	320	12-13	monomeric	Yes	L01
C8	Similar but less retentive than C18	Silica	3,5,10	100	320	8	monomeric	Yes	L07

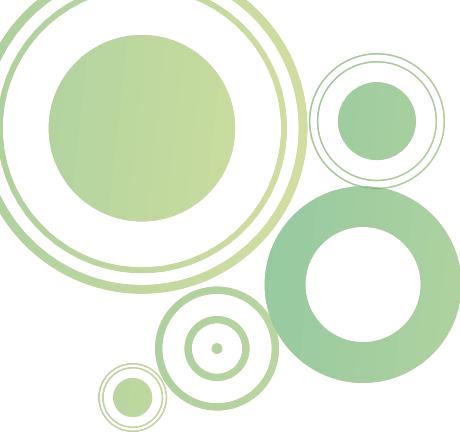

## C) HECTOR-T: Enhanced durability

HECTOR-T has a higher acid and base durability than monofunctional C18. The wide range of pH conditions supports the easy optimization of separation conditions. In addition, the tailing factor of the basic compounds has been improved. The polymeric-bonded phase from trifunctional silane may be more stable than the monomeric phases at a low pH.

- Differentiated Phases: C18
- Specifications: Spherical silica, Trifunctional bonded, endcapped, 100 Å pore size
- Format: Analytical, Semi-prep

HECTOR-T: Enhanced durability

Phase	Description	Base	Particle size (µm)	Pore Size (Å)	Surface Area(m <sup>2</sup> /g)	Carbon Load(%)	Phase Type	End-capping	USP
C18	C18 is based on trifunctional silane chemistry. More stability for wide pH range	Silica	3,5,10	100	320	19	Trifunctional	Yes	L01

#### D) HECTOR-W: Wide pore for compounds with large molecule like protein & Peptide

HECTOR-W is a 300 Å wide-pore silica with C18, C8, C4 and NH<sub>2</sub> derivatizations. This wide-pore silica is for the separation of peptides, proteins, and oligonucleotides. The derivatization type is selected by target compound property.

- Differentiated Phases: C18, C8, C4, NH<sub>2</sub>
- Specifications: Spherical silica, monomerically bonded, endcapped, 300 Å pore size
- Format: Analytical, Semi-prep

#### HECTOR-W: Wide pore for compounds with large molecule like protein & peptide

Phase	Description	Base	Particle size (µm)	Pore Size (Å)	Surface Area(m <sup>2</sup> /g)	Carbon Load(%)	Phase Type	End-capping	USP
C18	C18 bonded wide pore silica, it can be used for a wide range of molecular weights.	Silica	3,5,10	300	-	7	monomeric	Yes	L01
C8	When C18 is too retentive. It has lower C% than C18.	Silica	3,5,10	300	-	4	monomeric	Yes	L07
C4		Silica	3,5,10	300	-	3	monomeric	Yes	L26
NH <sub>2</sub>	Polar phase that can be used normal and ionexchange mode	Silica	3,5,10	300	-	-	monomeric	Yes	L08

#### E) HECTOR-ACD: Dedicated for separation of acidic compounds

- Differentiated Phases: WCX (Weak Cation Exchange), SCX (Strong Cation Exchange)
- Specifications: Spherical silica, monomerically bonded, endcapped, 100 Å pore size
- Format: Analytical, Semi-prep

#### HECTOR-ACD: Dedicated for separation of acidic compounds

Phase	Description	Base	Particle size (µm)	Pore Size (Å)	Surface Area(m <sup>2</sup> /g)	Carbon Load(%)	Phase Type	End-capping	USP
WCX	COOH boned silica surface	Silica	3,5,10	100	320	6-7	monomeric	Yes	
SCX	SO <sub>3</sub> H boned silica surface	Silica	3,5,10	100	320	5	monomeric	Yes	

## 1-3) Column Naming

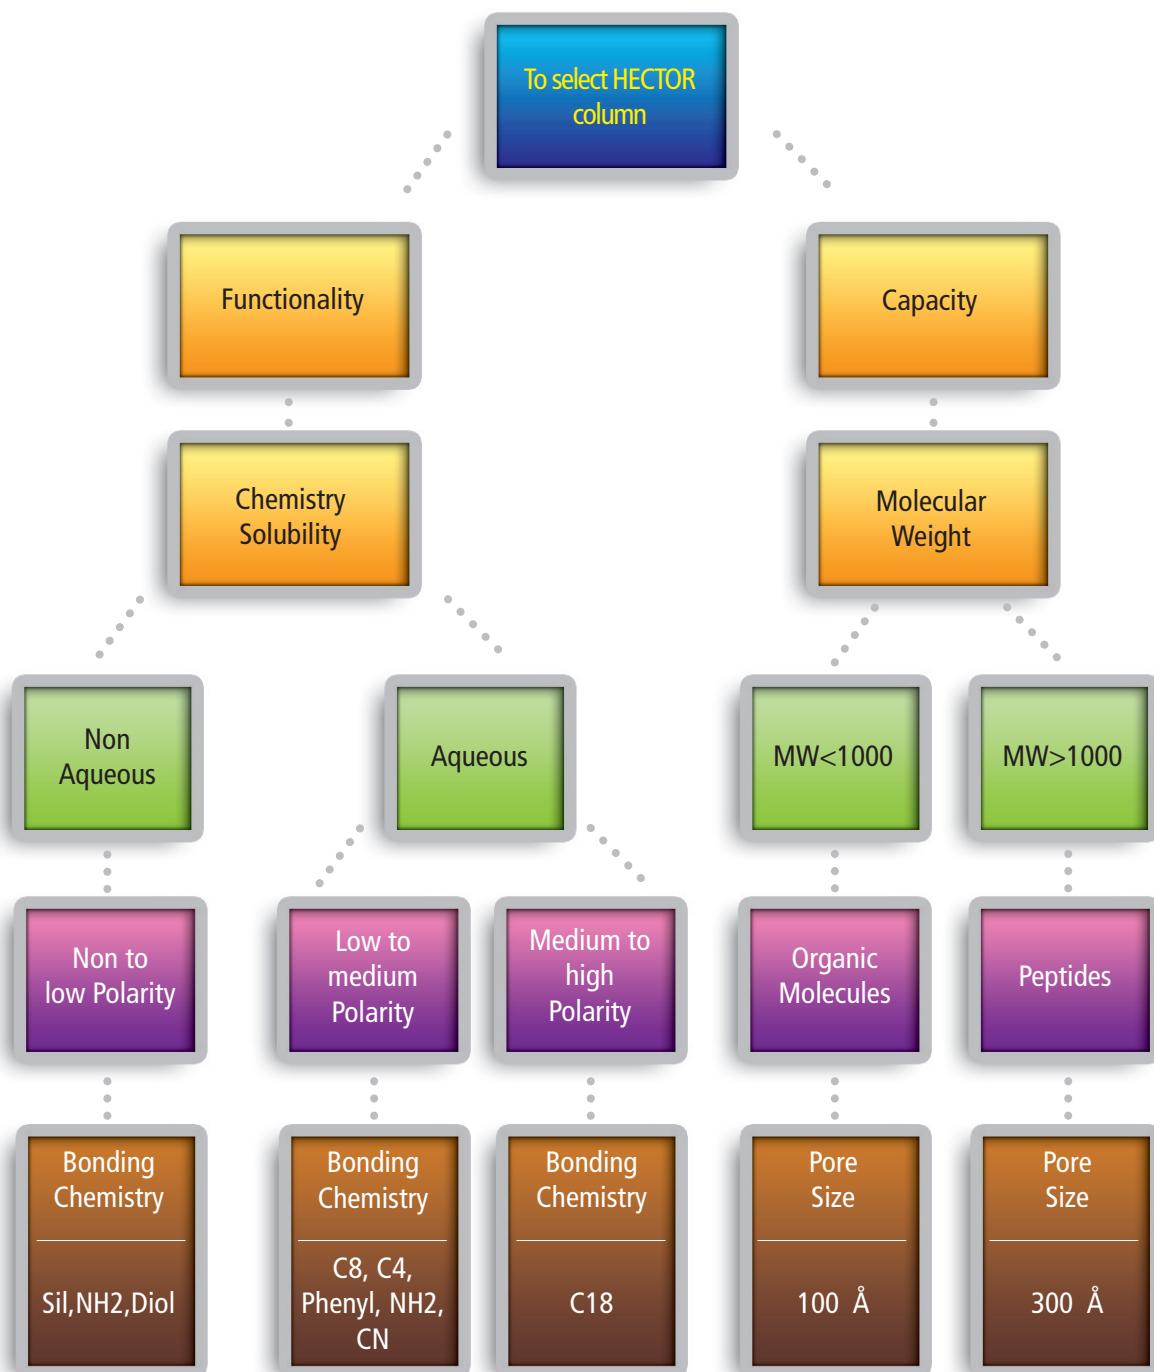

Ex) part number: C18-M31000521

C18	M	3	100	05	21	
Bonding Chemistry	Column line-up		Particle size(μm)	Pore size (Å)	Length(mm)	ID (mm)
C18, C8, C4, NH <sub>2</sub> , Diol, CN, Phenyl, Sil, WCX, SCX	M	Wide range application	3, 5, 10	100, 300	50, 70, 100, 150, 250	2.1, 3.0, 3.9, 4.6, 10.0, 21.2
	A	Usable under 100% aqueous condition				
	T	Tri-functional bonded phase				
	W	Wide pore for compounds with large molecule like protein & Peptide				
	ACD	Dedicated for separation of acidic compounds				

## 1-4) Column Selection Guide

Column selection tree

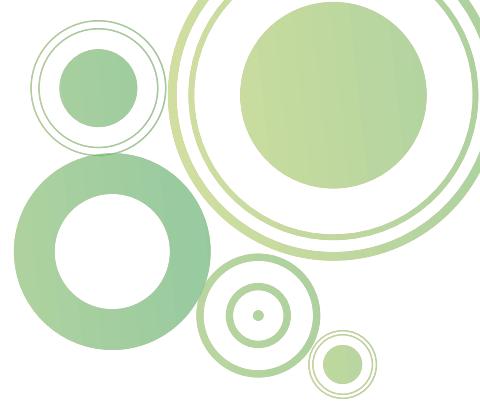

## HPLC Column Selection by Application

Vitamins	HECTOR-M C18 HECTOR-A C18 HECTOR-T C18

## Column Selection by USP Listing

USP No.	Kind	USP Description	HECTOR Phases
L01	C18	Octadecyl silane <ODS or C18> chemically bonded to porous silica or ceramic particles, 1.5 to 10 micron in diameter.	HECTOR-M C18 HECTOR-A C18 HECTOR-T C18 HECTOR-W C18
L03	Sil	Porous silica particles, 3 to 10 micron in diameter.	HECTOR-M Sil
L07	C8	Octyl silane <C8> chemically bonded to porous silica particles, 1.5 to 10 micron in diameter.	HECTOR-M C8 HECTOR-A C8 HECTOR-T C8 HECTOR-W C8
L08	NH2	An essentially monomolecular layer of aminopropylsilane <NH2> chemically bonded to totally porous silica gel support, 3 to 10 micron in diameter.	HECTOR-M NH2 HECTOR-W NH2
L9	Strongly acidic cation group	Irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating, 3 to 10 micron in diameter.	HECTOR-ACD SCX
L10	CN	Nitrile groups <CN> chemically bonded to porous silica particles, 3 to 10 micron in diameter.	HECTOR-M CN
L11	Phenyl	Phenyl groups chemically bonded to porous silica particles, 1.5 to 10 micron in diameter.	HECTOR-M Phenyl
L20	Diol	Dihydroxypropane groups chemically bonded to porous silica particles, 5 to 10 micron in diameter.	HECTOR-M Diol
L26	C4	Butyl silane <C4> chemically bonded to porous silica particles, 3 to 10 micron in diameter.	HECTOR-M C4 HECTOR-A C4 HECTOR-W C4

Recommended HECTOR columns are not guaranteed to provide the same retention or selectivity.

## II. HECTOR-M

### 2-1) Introduction

Wide range selection of stationary phase supports customer demands from analytical to Semi-prep scale. For reversed phase mode, C18, C8, C4, NH<sub>2</sub>, CN and phenyl phase are available depend on the polarity. On the other hands, Sil, NH<sub>2</sub>, Diol, and CN are available for normal phase mode. These normal phase columns cover to separate acidic, neutral, and basic compounds by right choice of stationary phase.

### 2-2) Advantages

- First choice for most regular samples
- High coverage and exhaustive end-capping
- Sharp peak shape
- Exceptional batch-to-batch reproducibility
- Enhanced mechanical stability
- Suitable for acidic, basic, neutral compounds separation
- High resolution
- High efficiency
- High peak capacity
- Low metal content in silica

### 2-3) Column Character

#### A)NIST test for HECOTR column Characterization

National Institute of Standards & Technology Standard Reference Material 870, NIST SRM 870 is a mixture of five organic compounds in methanol intended for use in characterizing general aspects of liquid chromatographic (LC) column performance, including efficiency, void volume, methylene selectivity, retentiveness, and activity toward chelators and organic bases. Other possible uses include (1) column classification to aid column selection during method development, (2) as a control material for monitoring LC column performance over time, and (3) in quality control for column manufacturing. SRM 870 consists of a mixture of the following five organic compounds in methanol: uracil, toluene, ethylbenzene, quinizarin, and amitriptyline (see Figure 1 for structures).

HEC

Fig.1 Structures and properties evaluated for components in SRM 870

Component	Property evaluated
Uracil 	Void volume marker
Toluene, Ethylbenzene 	Hydrophobic retention, Efficiency
Quinizarin 	Activity towards chelating reagents
Amitriptyline 	Activity towards bases

#### Chromatographic condition

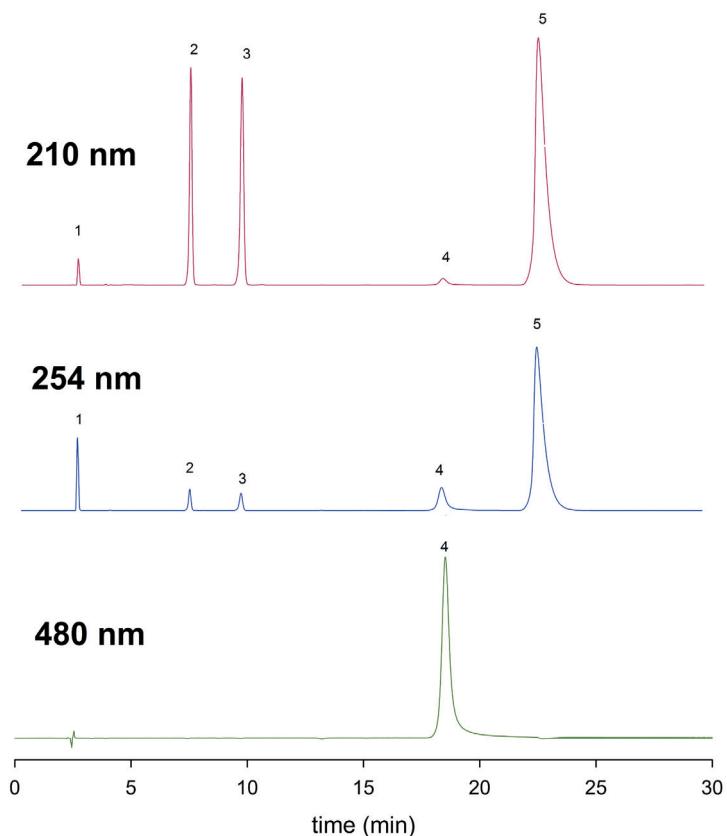

Mobile phase: 20 % 20 mM phosphate buffer pH 7.0 in methanol  
Flow rate: 1 mL/min  
Temperature: 23 °C  
Injection column: 1-2 µl  
Detection: 210, 254, 480 nm  
LC system: Agilent 1100

#### Sample

1. Uracil (28 µg/g)
2. Toluene (1400 µg/g)
3. Ethylbenzene (1700 µg/g)
4. Quinizarin (94 µg/g)
5. Amitriptyline (2800 µg/g)  
in Methanol

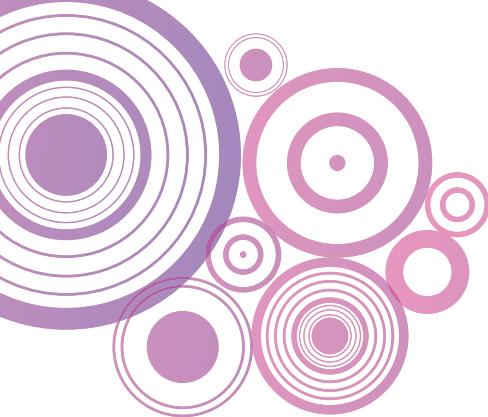

Fig. 2 Test result of SRM 870

Toluene and/or ethylbenzene are useful markers for the calculation of column efficiency. The number of its theoretical plates is higher than 20,000. The HECTOR-M C18 column demonstrates excellent separation, capacity, and efficiency. Low activity towards chelating reagents is indicated by a symmetric peak shape, and high activity towards chelating reagents is indicated by a tailing, asymmetric peak shape. As shown in Fig. 2, HECTOR-M C18 surface has less metal purity.

Amitriptyline is a basic ( $pK_a=9.4$ ) pharmaceutical drug (antidepressant) commonly used for column characterization indicating silica-surface silanol activity. Elution of organic bases with severe peak tailing is often associated with high silanol activity, but the elution of such compounds with symmetrical peak shapes is considered indicative of column deactivation. The result showed good symmetry, which points to low silanol activity.

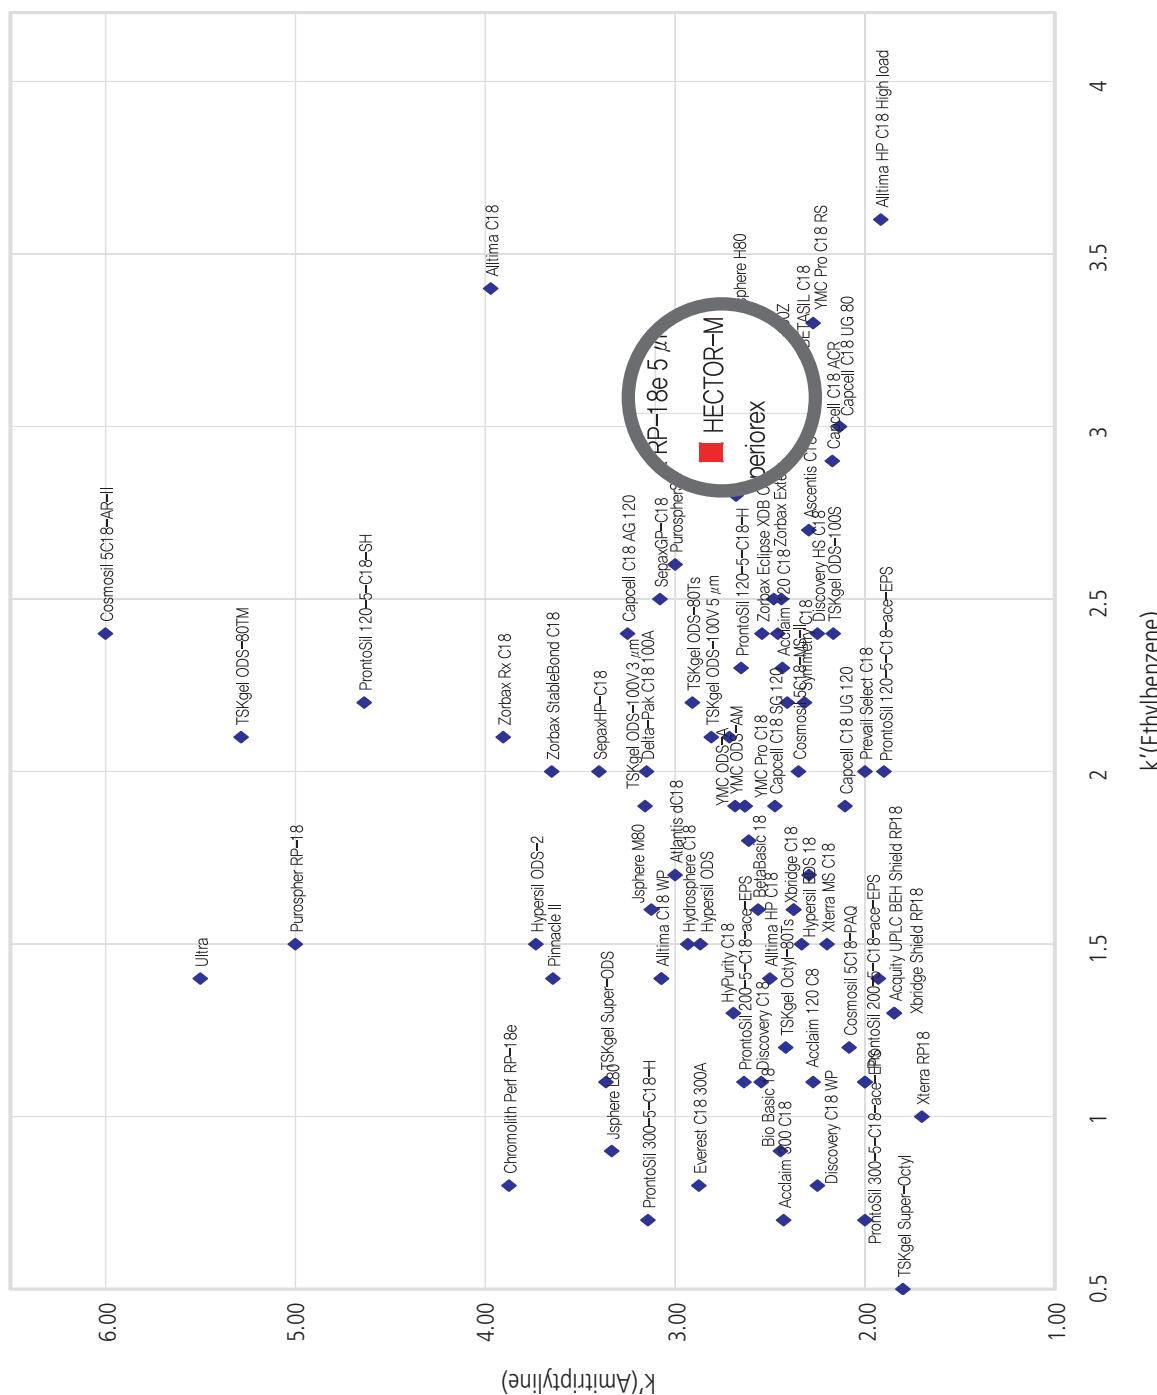

HECTOR columns are manufactured under well-controlled conditions and with fully end-capped surfaces. They can reduce secondary interaction with unreacted silanols. They thus have improved peak shapes for bases.

HEC

### B)Character Zone

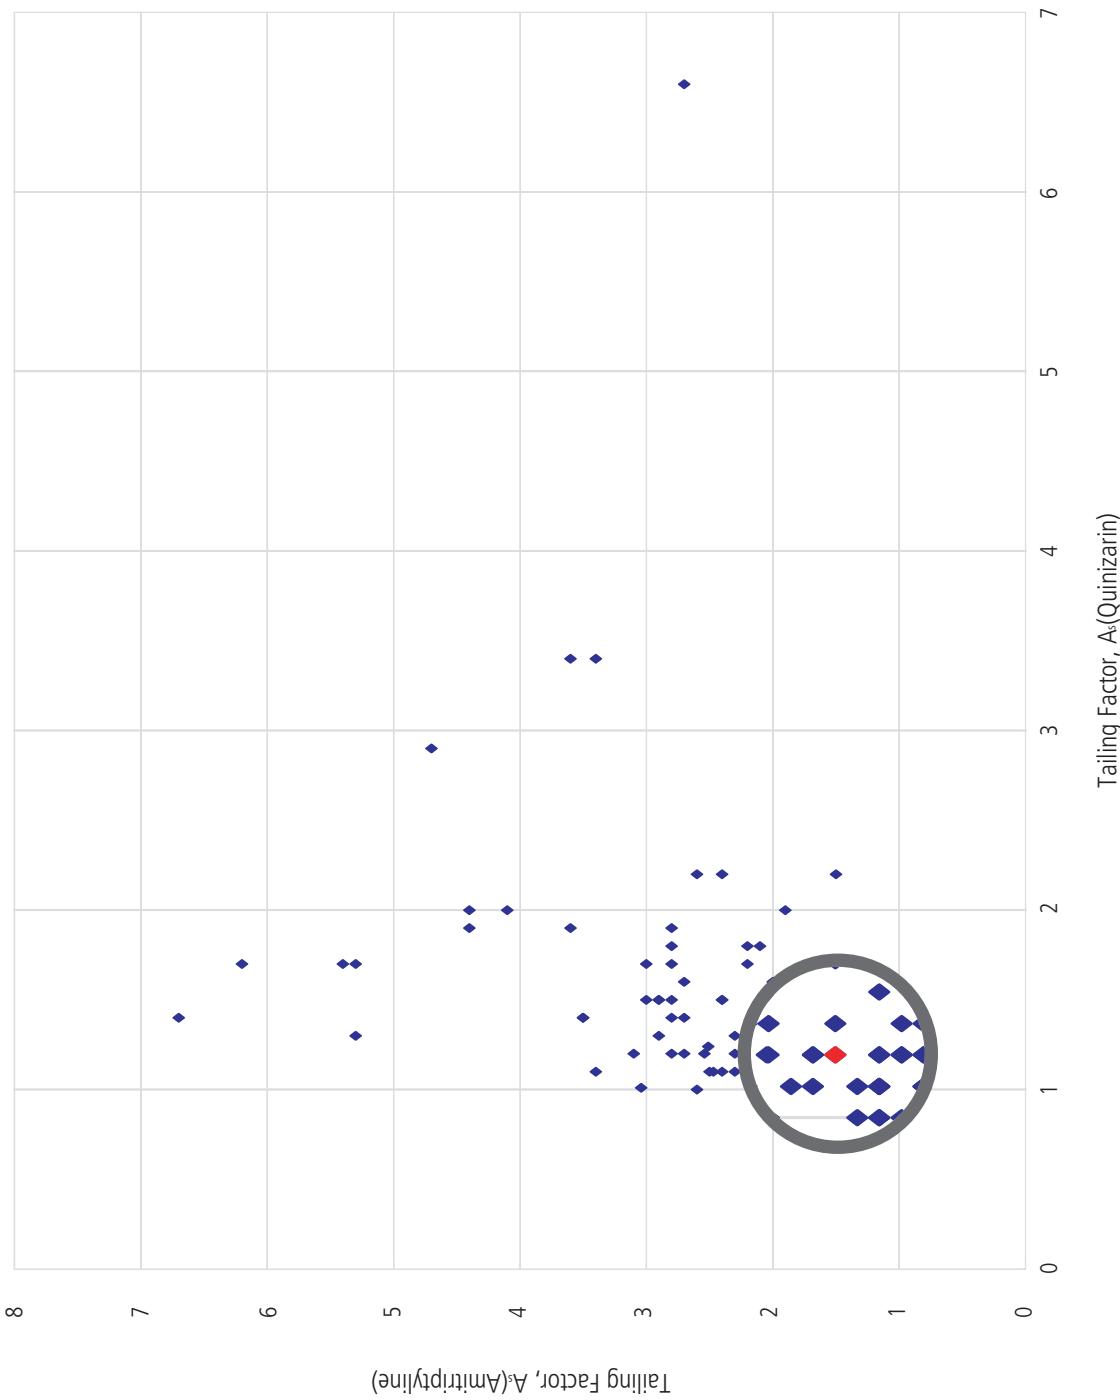

## Hydrophobic/Hydrophilic Balance at pH of Various Reversed-Phase HPLC Packings

HPLC condition is same SRM 870 TEST.

Plotting  $k'$  values of different compounds (polar vs. nonpolar) demonstrate the unique selectivity of HECTOR-M C18.

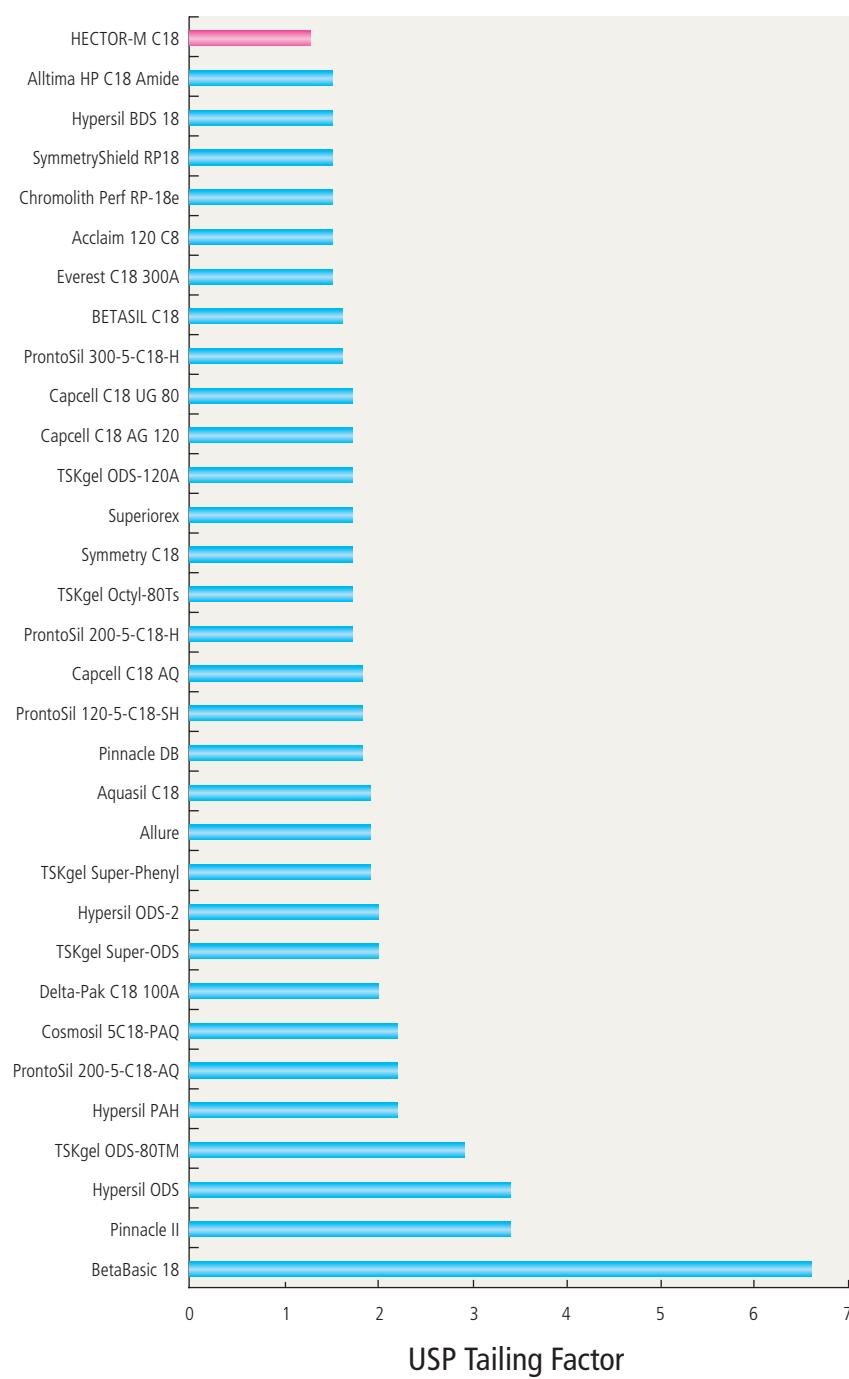

HEC

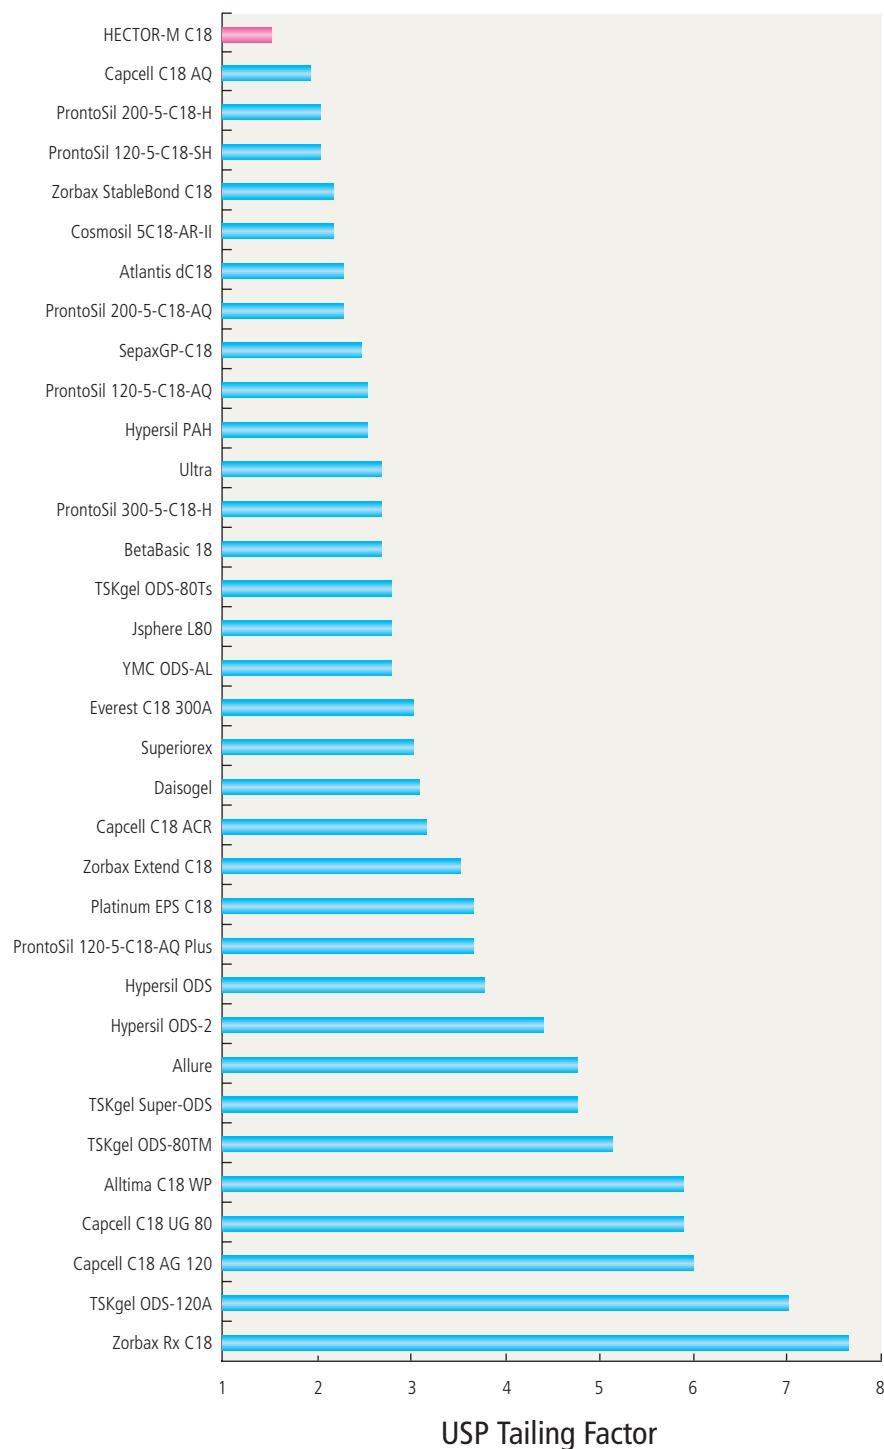

### C) Symmetry (USP Tailing factor)

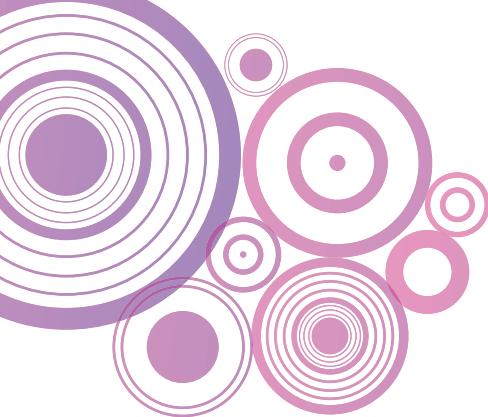

Comparison of metal activity using the NIST Test: Qunizarin asymmetry

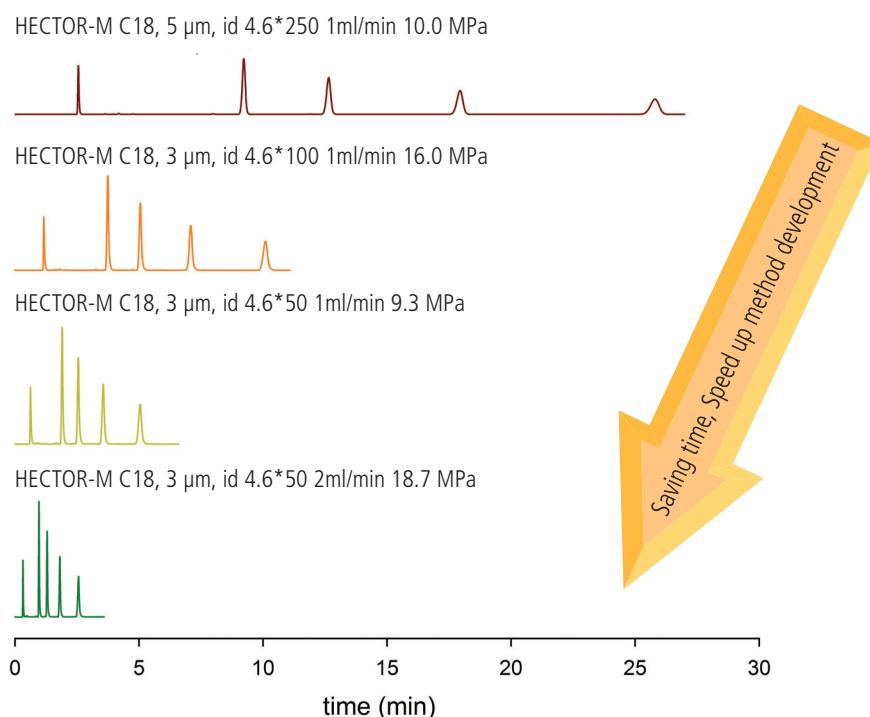

Comparison of silanol activity using the NIST Test : Amitriptyline asymmetry

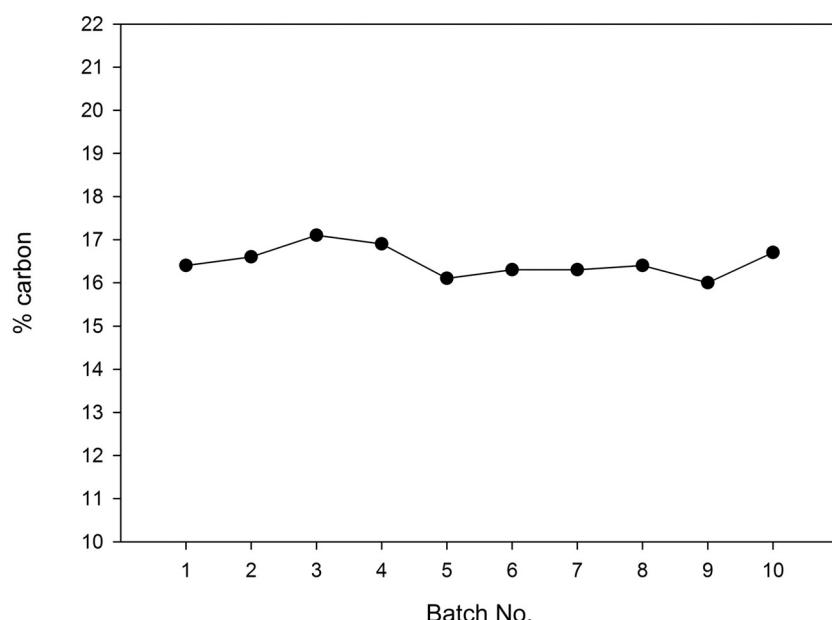

HEC

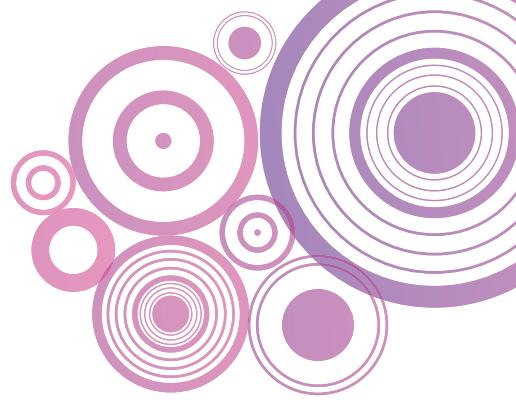

#### D) Efficiency of Particle Size and Column Length

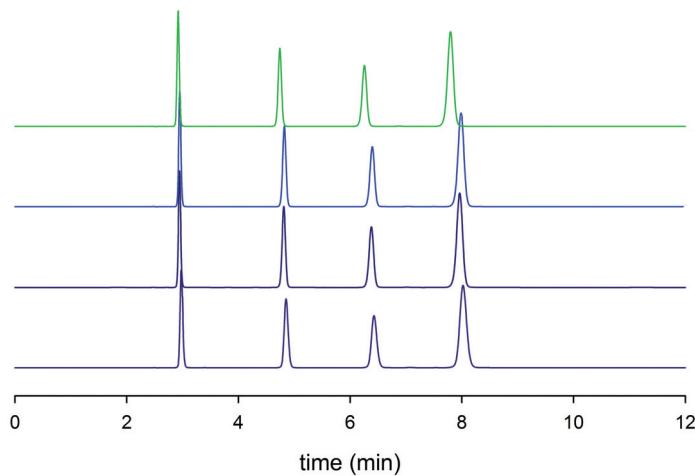

#### E) Batch-to-Batch Reproducibility

Silica Lot to Lot Data of HECTOR-M C18

Column to Column Reproducibility Data of HECTOR-M C18

## HECTOR-M C18

Column Size: 4.6 x 250 mm

Mobile phase: MeOH/H<sub>2</sub>O = 90/10

Temperature: 25 °C

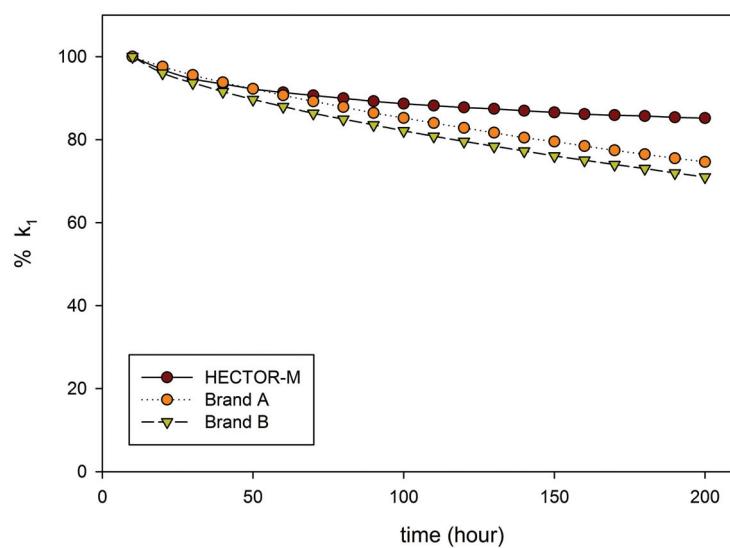

Detection: UV @ 254 nm

Flow rate: 1 mL/min

- Sample:
1. Phenol
  2. Toluene
  3. Biphenyl
  4. Phenanthrene

## F) Low pH Stability

HECTOR-M C18 Acid resistance test

Column size : 150 X 4.6 mm  
 Mobile phase : 20 % MeOH / H<sub>2</sub>O in 1 vol % TFA  
 Temperature : 60 °C  
 Flow Rate : 1 mL/min  
 Detection : UV@254 nm  
 Sample : Benzyl alcohol, 1 mg/mL in 5 μL  
 Sample injection at every one hour for 20 hours.

## 2-4) Product Details

### A) HECTOR-M C18

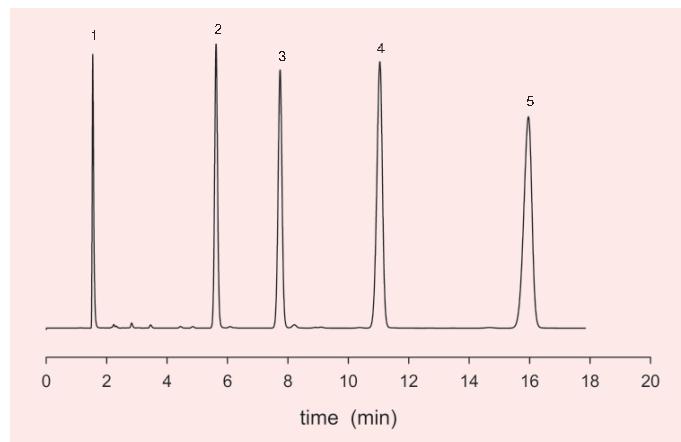

HECTOR-M C18 is the most versatile and popular reversed phase. It is extremely suitable for the validation of various analytes. It has an about 17 % carbon load and is fully end-capped. It provides high selectivity, efficiency, and a good peak shape.

#### Specification

- Particle size: 3,5,10 µm
- Pore size: 100 Å
- Carbon contents: about 17 %
- Usable pH range: 2-8

#### Standard chromatogram

Column: HECTOR-M C18  
 Dimension: 150 x 4.6 mm  
 Mobile phase: MeOH/H<sub>2</sub>O = 80/20  
 Temperature: 35 °C  
 Detection: UV @ 254 nm  
 Flow rate: 1 mL/min  
 Sample:  
 1. Uracil  
 2. Ethylbenzene  
 3. N-Propylbenzene  
 4. N-Butylbenzene  
 5. N-Amylbenzene

## B) HECTOR-M C8

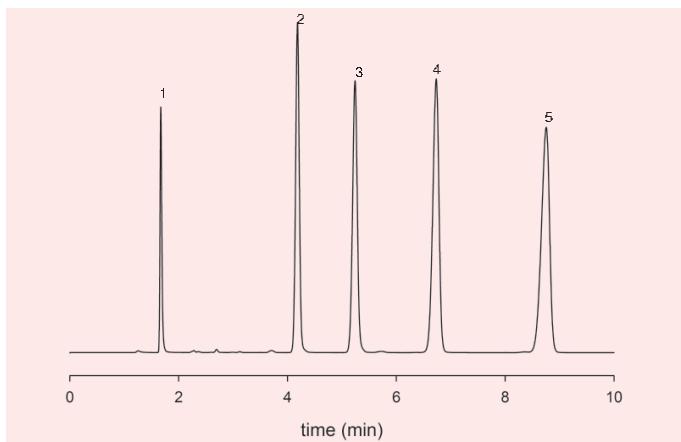

HECTOR-M C8 is packed with alkylchaine-group-bonded silica particles. It has a lower carbon load than HECTOR-M C18. We recommend HECTOR-M C8 when the sample has a high retention time. It can be used for pharmaceutical, environmental, food, and other industrial chromatographic separations. It provides less retention and greater speed.

### Specification

- Particle size: 3,5,10 µm
- Pore size: 100 Å
- Carbon contents : about 10 %
- Usable pH range: 2-8

### Standard chromatogram

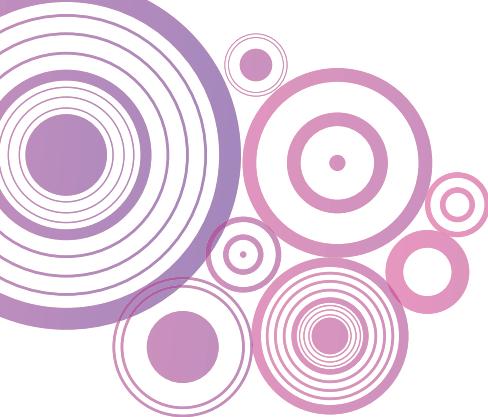

Column: HECTOR-M C8  
 Dimension: 150 x 4.6 mm  
 Mobile phase: MeOH/H<sub>2</sub>O =80/20  
 Temperature: 35 °C  
 Detection: UV @ 254 nm  
 Flow rate: 1 mL/min  
 Sample:

### C) HECTOR-M C4

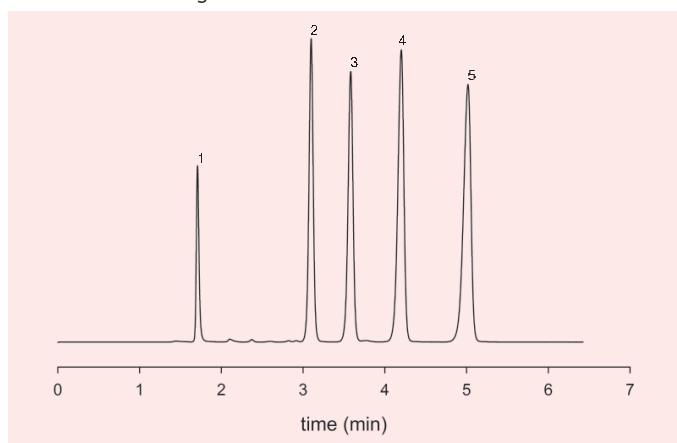

HECTOR-M C4 is packed with alkylchaine-group-bonded silica particles. It has a lower carbon load than HECTOR C18 and HECTOR C8. We recommend HECTOR-M C4 when the sample has a high retention time. It can be used for pharmaceutical, environmental, food, and other industrial chromatographic separations. It provides less retention and greater speed.

#### Specification

- Particle size: 3, 5, 10  $\mu\text{m}$
- Pore size: 100 Å
- Carbon contents : about 3 %
- Usable pH range: 2-8

#### Standard chromatogram

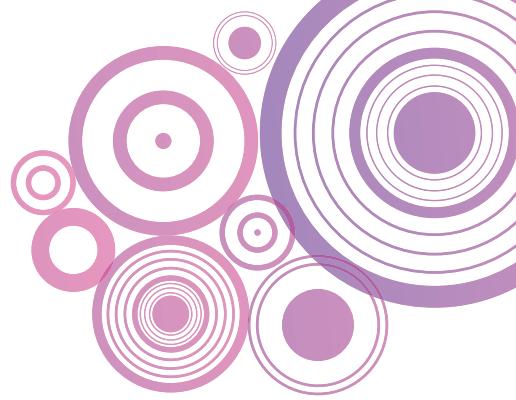

Column: HECTOR-M C4  
 Dimension: 150 x 4.6 mm  
 Mobile phase: MeOH/H<sub>2</sub>O =80/20  
 Temperature: 35 °C  
 Detection: UV @ 254 nm

## D) HECTOR-M NH2

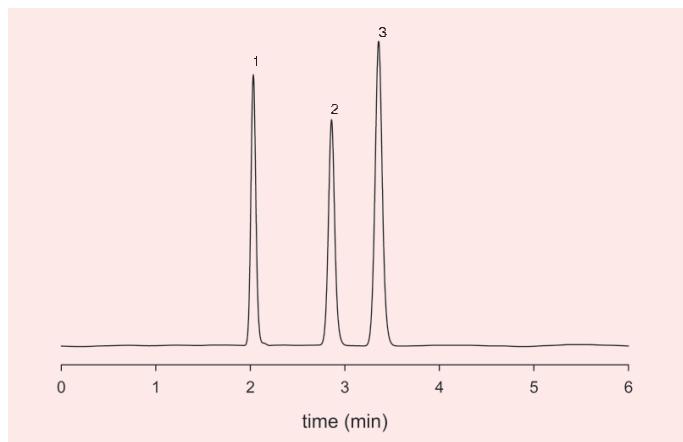

The NH<sub>2</sub>-modified stationary phase can be used in the HILIC, IEC, and NP modes. The HILIC mode is for the separation of polar compounds, such as carbohydrates. In the IEC mode, the NH<sub>2</sub> phase works as a weak anion exchanger in aqueous buffers at a low pH. In the NP mode, it is useful for separating basic compounds because the plus charge of the surface prevents ionic interaction with basic compounds.

### Specification

- Particle size: 3,5,10 µm
- Pore size: 100 Å
- Carbon contents: about 4 %
- Usable pH range: 2-8

### Standard chromatogram

Column: HECTOR-M NH2  
 Dimension: 150 x 4.6 mm  
 Mobile phase: Heptane/Ethyl acetate =90/10  
 Temperature: 25 °C  
 Detection: UV @ 254 nm  
 Flow rate: 1 mL/min  
 Sample: 1. Ethylbenzene  
 2. 2-Chloro-6-nitrotoluene  
 3. Nitrobenzene

HEC

## F) HECTOR-M Diol

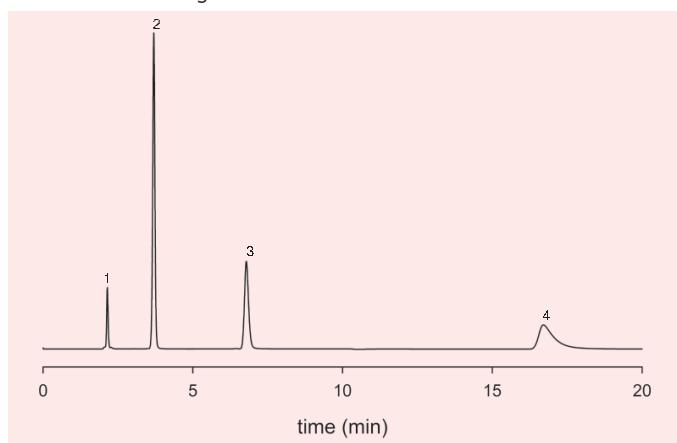

The diol-modified normal phase has a neutral hydroxyl group and is thus a more versatile alternative to silica. The hydrogen bonding on the diol layer is not as strong as with that on silanol on a bare silica surface, and shows improved reproducibility. The diol matrix is very easy wettable and is appropriate for the separation of neutral, acidic, and basic compounds.

### Specification

- Particle size: 3,5,10 µm
- Pore size: 100 Å
- Carbon contents: about 4 %
- Usable pH range: 2-8

### Standard chromatogram

Column: HECTOR-M Diol  
Dimension: 150 x 4.6 mm  
Mobile phase: MeOH/Hexane = 1/99  
Temperature: 35 °C  
Detection: UV @ 254 nm  
Flow rate: 1 mL/min  
Sample: 1.Benzene  
2.Dibutyl phthalate  
3.Phenol  
4.Pyridine

## G) HECTOR-M CN

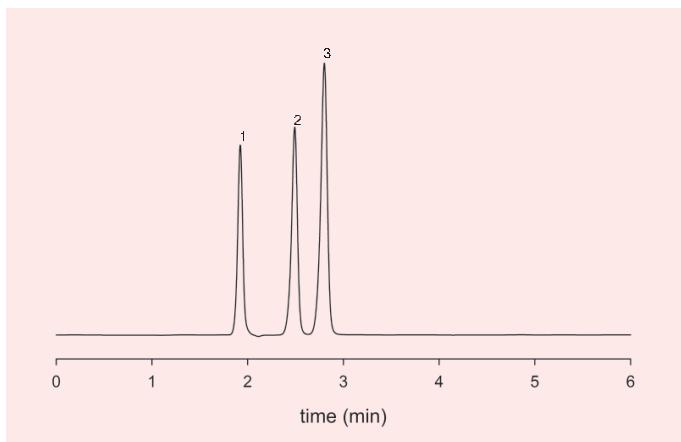

The Nitril-bonded phase is the most polar and the least retentive RP mode. In the case of the RP mode, the CN-modified phase is for the separation of extremely hydrophobic compounds. In the case of the NP mode, the CN-modified phase shows more uniform surface activity and often increased resistance to possible dissolution compared to bare silica.

### Specification

- Particle size: 3,5,10 µm
- Pore size: 100 Å
- Carbon contents: about 6-7 %
- Usable pH range: 2-8

### Standard chromatogram

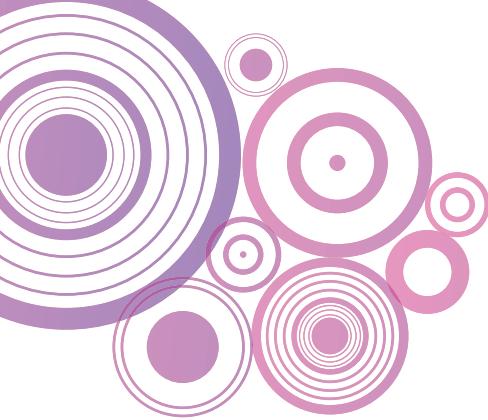

Column: HECTOR-M CN  
 Dimension: 150 x 4.6 mm  
 Mobile phase: Heptane/Ethyl acetate =90/10  
 Temperature: 25 °C  
 Detection: UV @ 254 nm  
 Flow rate: 1 mL/min  
 Sample: 1. Ethylbenzene  
 2. 2-Chloro-6-nitrotoluene  
 3. Nitrobenzene

HEC

## H) HECTOR-M Phenyl

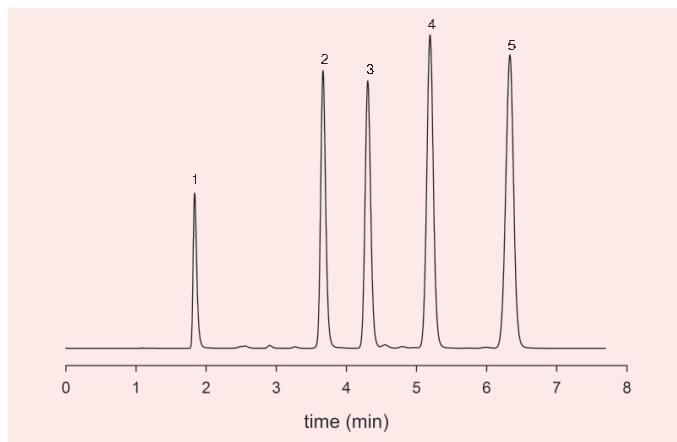

The phenyl-modified stationary phase has  $\pi$ -electrons. The hydrophobic and  $\pi$ - $\pi$  interactions between the stationary phase and the solute show unique separation characteristics compared with the alkyl-bonding stationary phases, such as C18, C8, and C4.

### Specification

- Particle size: 3,5,10  $\mu\text{m}$
- Pore size: 100 Å
- Carbon contents: about 10 %
- Usable pH range: 2-8

### Standard chromatogram

Column: HECTOR-M Phenyl  
Dimension: 150 x 4.6 mm  
Mobile phase: MeOH/H<sub>2</sub>O =80/20  
Temperature: 35 °C  
Detection: UV @ 254 nm  
Flow rate: 1 mL/min  
Sample: 1.Uracil  
2.Ethylbenzene  
3.N-Propylbenzene  
4.N-Butylbenzene  
5.N-Amylbenzene

## I) HECTOR-M Sil

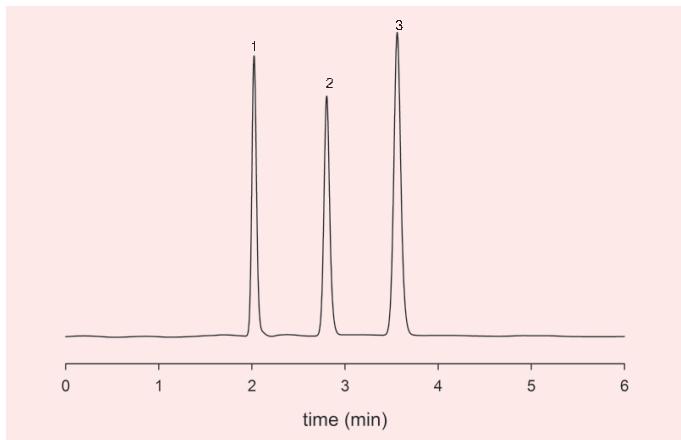

Sil stationary phase is widely used in normal phase separation. Especially, separation of position isomer and lipid-soluble compounds is effective. HECTOR-M Sil is produced by high purity silica (99.99 % purity) and enhanced mechanical strength.

### Specification

- Particle size: 3,5,10  $\mu\text{m}$
- Pore size: 100 Å
- Usable pH range: 2-8

### Standard chromatogram

Column: HECTOR-M Sil  
 Dimension: 150 x 4.6 mm  
 Mobile phase: Heptane/Ethyl acetate =90/10  
 Temperature: 25 °C  
 Detection: UV @ 254 nm  
 Flow rate: 1 mL/min  
 Sample: 1. Ethylbenzene  
 2. 2-Chloro-6-nitrotoluene  
 3. Nitrobenzene

### III. HECTOR-A

#### 3-1) Introduction

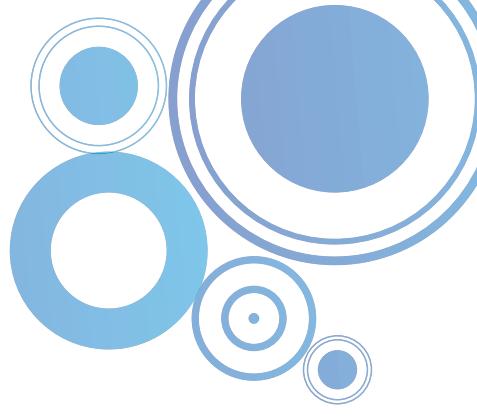

HECTOR-A's packing surface allows the use of 100 % water as an eluent, enabling good solvation between the mobile and hydrophilic surfaces. The HECTOR-A phases can be used for the separation of hydrophobic compounds without a phenomenon commonly known as "phase collapse". HECTOR-A packing introduces high-purity  $\text{SiO}_2 > 99.99\%$ , which points to a total metal content of <100 ppm. As such, it provides a good peak shape and reproducibility.

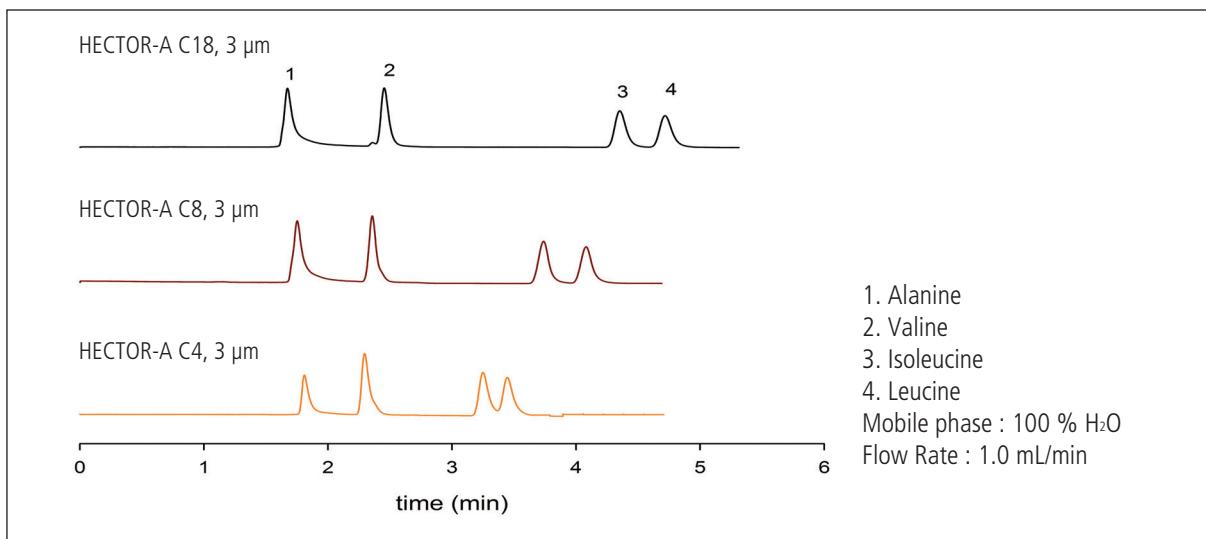

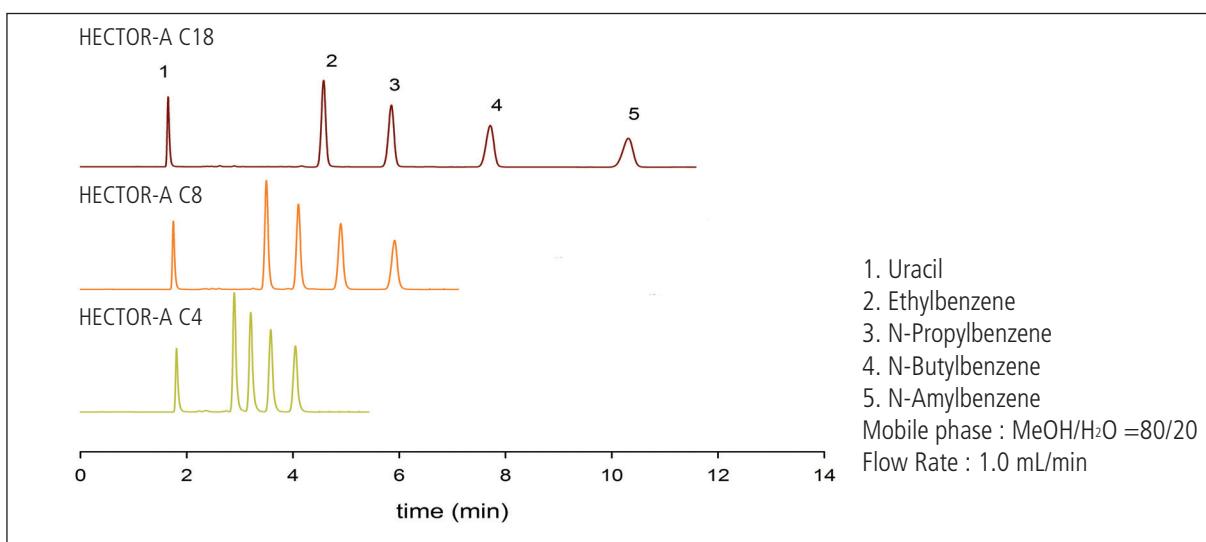

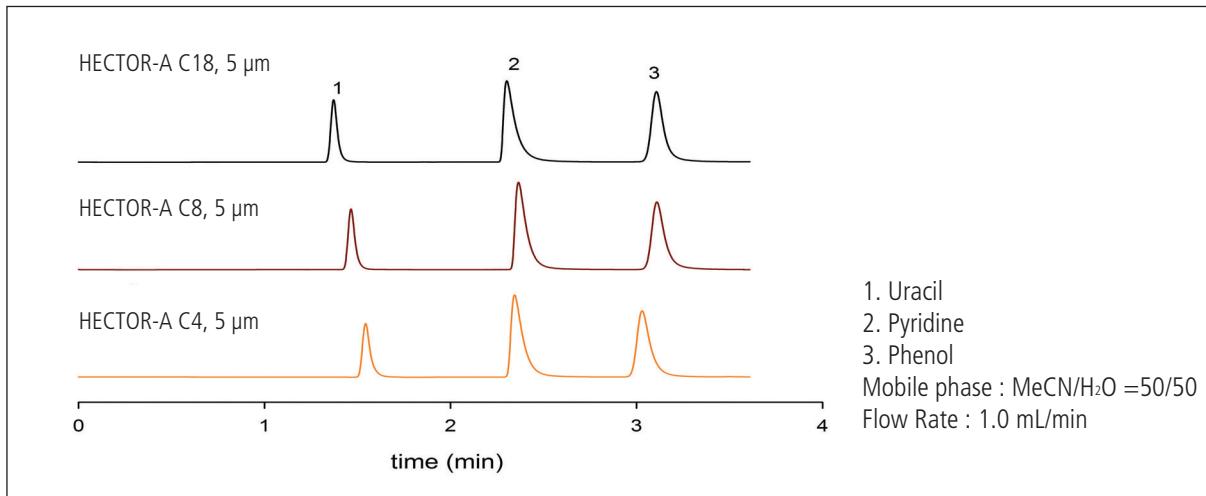

#### 3-2) Advantages

- Designed for separating hydrophilic and polar compounds
- Good stability in 100 % aqueous mobile phases
- Rapid equilibration
- Unique reversed-phase selectivity

### 3-3) Column Character

HEC

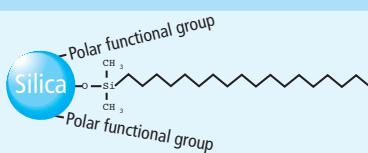

### 3-4) Product details

#### A) HECTOR-A C18

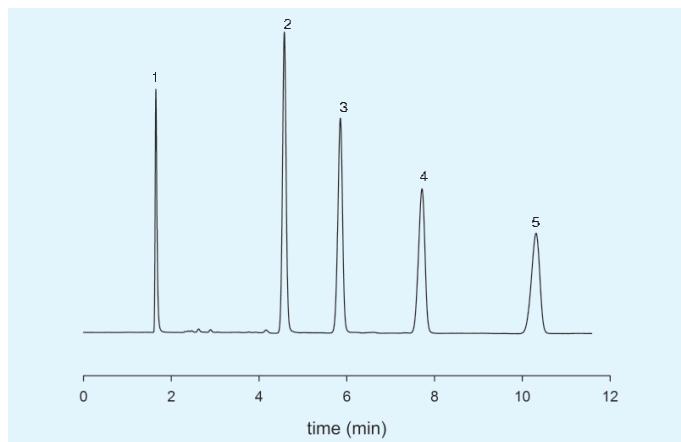

The HECTOR-A C18 phase shows similar selectivity as the conventional C18 phases when used for the separation of hydrophobic compounds with typical reversed-phase mobile phases. It is thus suitable for use as a unique universal C18 column.

##### Specification

- Particle size: 3,5,10 µm
- Pore size: 100 Å
- Carbon contents: about 12-13 %
- Usable pH range: 2-8

##### Standard chromatogram

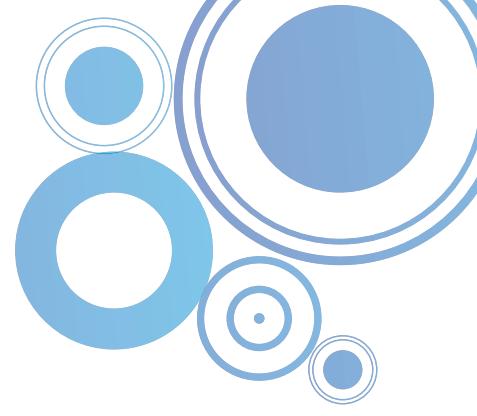

Dimension: 250 x 4.6 mm  
Mobile phase: MeOH/H<sub>2</sub>O = 80/20  
Temperature: 35 °C  
Detection: UV @ 254 nm  
Flow rate: 1 mL/min  
Sample:  
1. Uracil  
2. Ethylbenzene  
3. N-Propylbenzene  
4. N-Butylbenzene  
5. N-Amylbenzene

## B) HECTOR-A C8

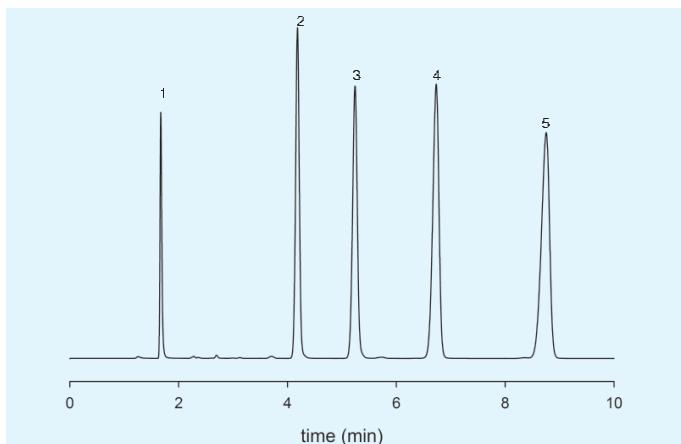

Besides C18, universal C8 is the material of choice for investigation. HECTOR-A C8 offers a "hydrophilic" alternative for the regular C8 material.

### Specification

- Particle size: 3,5,10 µm
- Pore size: 100 Å
- Carbon contents: about 8 %
- Usable pH range: 2-8

### Standard chromatogram

Dimension: 250 x 4.6 mm  
 Mobile phase: MeOH/H<sub>2</sub>O = 80/20  
 Temperature: 35 °C  
 Detection: UV @ 254 nm  
 Flow rate: 1 mL/min  
 Sample:

## IV. HECTOR-T

### HECTOR-T C18

The HECOTR-T C18 phase shows similar selectivity as the conventional C18 phases when used for the separation of hydrophobic compounds with typical reversed-phase mobile phases, but it has a fast analysis time. The HECTOR-T phase is available in trifunctional silica form. If the pH will be adjusted to acid values, it will be critical to use trifunctional silica to prevent the hydrolysis of the hydrocarbon group from the surface of HECTOR-T packings. This phase extends the stability, robustness, and reproducibility.

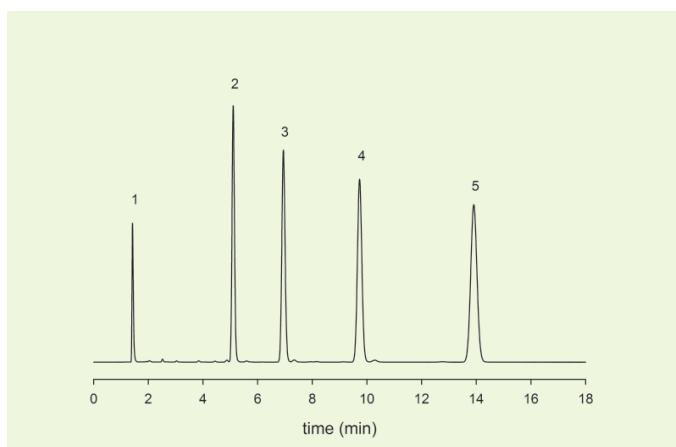

- Excellent robustness
- Extended column life time
- High reproducibility
- High efficiency
- Reduce analysis time

#### Specification

- Particle size: 3,5,10 µm
- Pore size: 100 Å
- Carbon contents: about 19 %
- Usable pH range: 2-9

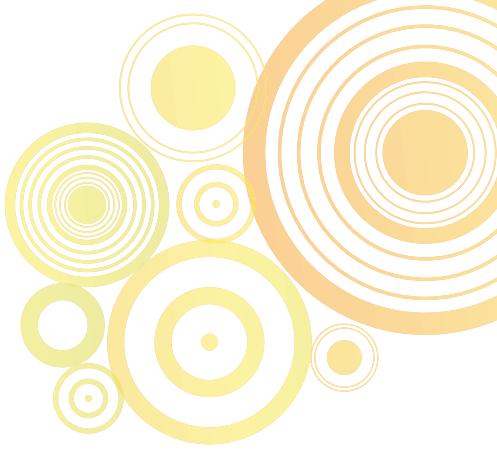

#### Standard chromatogram

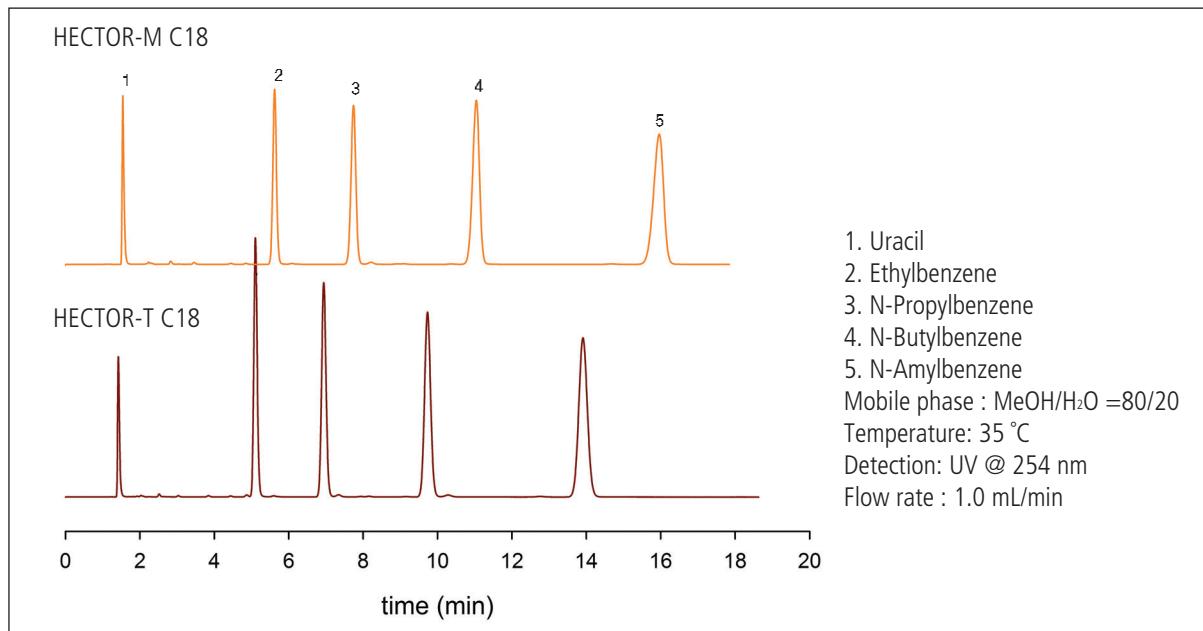

1. Uracil
  2. Ethylbenzene
  3. N-Propylbenzene
  4. N-Butylbenzene
  5. N-Amylbenzene
- Mobile phase : MeOH/H<sub>2</sub>O =80/20  
 Temperature: 35 °C  
 Detection: UV @ 254 nm  
 Flow Rate : 1.0 mL/min

Compared with HECTOR-M, it has a shorter retention factor and a brilliant stability even at a high pH. Its retention factor varies according to the length and chemistry of its alkyl chain. If the alkyl chain is identical, however, its retention factor will vary according to the bonding type.

## V. HECTOR-W

### A) HECTOR-W C18

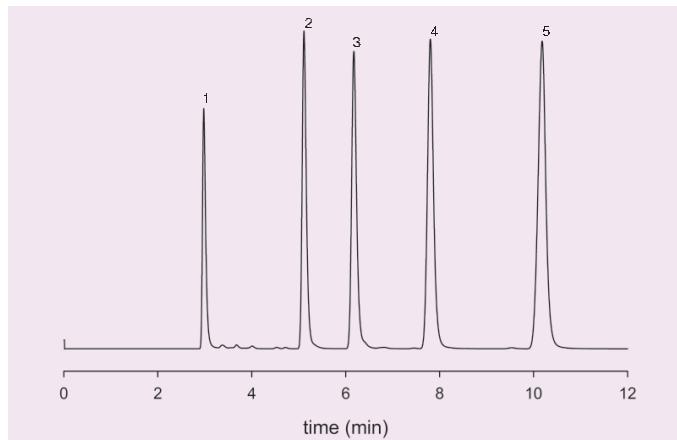

HECTOR-W is designed for the separation of biological compounds, such as proteins, peptides, nucleotides, and oligosaccharides. The HECTOR-W pore size affects analysis and provides high efficiency and a good peak shape. It is produced with the use of high-purity silica and is fully end-capped. It is available in 3, 5, and 10 µm particle sizes and in various column sizes. The advanced total end-capping system that is used in its production makes this material excellent for analyzing basic substances and some metal complexes, where any trace of residual silanol sites will cause peak tailing.

#### Specification

- Particle size: 3,5,10 µm
- Pore size: 300 Å
- Carbon contents: about 7 %
- Usable pH range: 2-8

#### Standard chromatogram

Dimension: 250 x 4.6 mm  
 Mobile phase: MeOH/H<sub>2</sub>O =80/20  
 Temperature: 35 °C  
 Detection: UV @ 254 nm  
 Flow rate: 1 mL/min  
 Sample: 1. Uracil  
     2. Ethylbenzene  
     3. N-Propylbenzene  
     4. N-Butylbenzene  
     5. N-Amylbenzene

## B) HECTOR-W C8

As it contains highly hydrophobic compounds, HECTOR-W C8 is a good alternative to HECTOR-W C18 when less retention is desired.

### Specification

- Particle size: 3,5,10 µm
- Pore size: 300 Å
- Carbon contents: about 4 %
- Usable pH range: 2-8

## D) HECTOR-W NH2

The NH2 phase is for reversed- or normal-phase separation. It is excellent for the reversed-phase analysis of sugars, sugar alcohols, and anionic compounds, or for hydrogen-bonding compounds, under normal-phase conditions.

### Specification

- Particle size: 3,5,10 µm
- Pore size: 300 Å
- Carbon contents: about 3 %
- Usable pH range: 2-8

### Product List

## VI. HECTOR-ACD

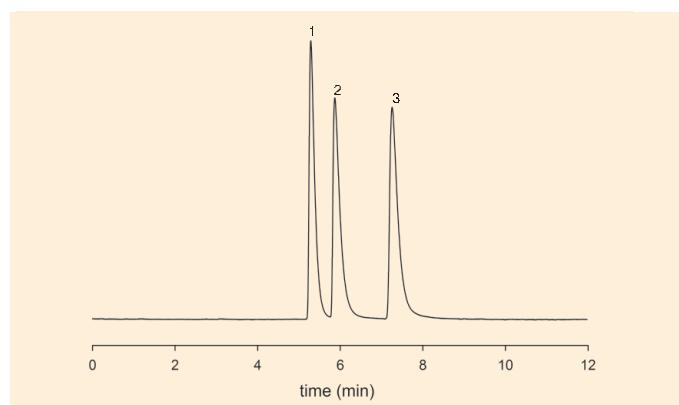

Liquid chromatography has been widely used for the purification of organic compounds. Especially, normal-phase chromatography using nonpolar solvents such as hexane and ethyl acetate has been applied due to the high solubility of its compounds and as it can be easily handled after treatment. There is separation difficulty with silica gel, however, depending on the characteristics of the compounds. Although adaptable media have been developed for compounds that have separation difficulty, there are no proper media for separating acid compounds with the carboxyl group, etc. HECTOR-ACD supplies a superior separation method for acidic compounds by introducing COOH and SO<sub>3</sub>H bonds on the silica surface (patent applied). This acid silica has been placed on the market for the separation of problematic compounds.

### Normal-phase silica grades

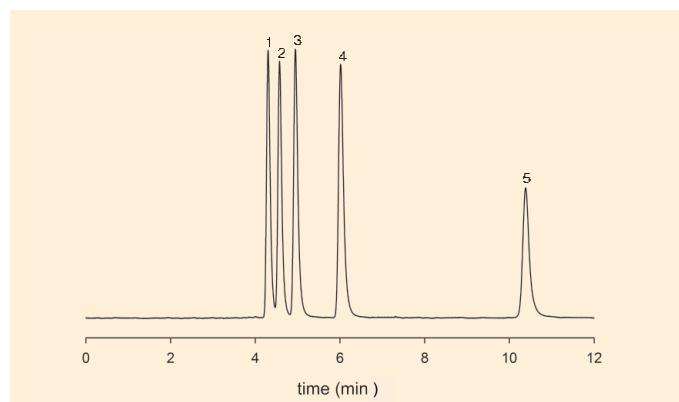

In the case of the normal-phase separation of organic compounds, it is necessary to select the proper media based on their characteristics. Neutral compounds are well separated by the contemporary silica gel. NH<sub>2</sub> and Diol silica are used for the separation of basic compounds. Additionally, "ACD silica" can be applied to acid compounds.

COOH silica: For the separation of ordinary acid compounds, but cannot be used for the separation of strong acid compounds

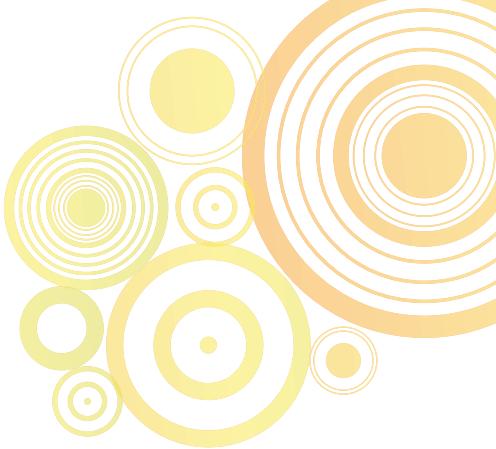

SO<sub>3</sub>H silica: For the separation of strong acid compounds. Please pay attention to the decomposition of the compounds due to the strong acid characteristics.

Column: HECTOR-ACD WCX  
Dimension: 250 x 4.6 mm  
Mobile phase: IPA/Hexane = 5/95  
Temperature: 35 °C  
Detection: UV @ 254 nm  
Flow rate: 1 mL/min  
Sample: 1. o-Toluic acid  
2. Benzoic acid  
3. trans-Cinnamic acid

Column: HECTOR-ACD SCX  
Dimension: 250 x 4.6 mm  
Mobile phase: IPA/Hexane = 5/95  
Temperature: 35 °C  
Detection: UV @ 254 nm  
Flow rate: 1 mL/min  
Sample: 1. o-Toluic acid  
2. Benzoic acid  
3. trans-Cinnamic acid  
4. Salicylic acid  
5. Phthalic acid

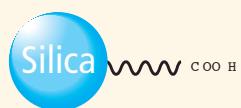

### A) HECTOR-ACD WCX (Weak Cation Exchange type)

To separate acidic compounds using normal-phase bare silica gel, the addition of acid to the solution is necessary. There is no problem with the use of a pH buffer as an agent in the case of analytical separation, but when performing preparative separation, the pH-buffering agent must be removed later in the process. As HECTOR-ACD WCX with an "immobilized-acid functional group" works just as well as a buffer, however, there is no need to add a TFA buffer.

#### Specification

- Particle size: 5 µm
- Pore size: 100 Å
- Carbon contents: about 6-7 %
- Usable pH range: 2-8

# optimapak

RStech has been concentrated on obtaining the best HPLC column in the market. We have focused all its efforts and all its know-how, accumulated through more than 10 years of chromatographic research and development. OptimaPak has a superb performance for a variety of applications in the pharmaceutical, chemical, environmental, and food separation areas. It provides better peak shape and column efficiency, high reproducibility.

The uniqueness of OptimaPak high performance spherical silica is the combination of:

- high surface area
- mechanical strength

Other outstanding properties are:

- chemical purity
- chemical stability
- optimized surface properties
- well-defined pore structure

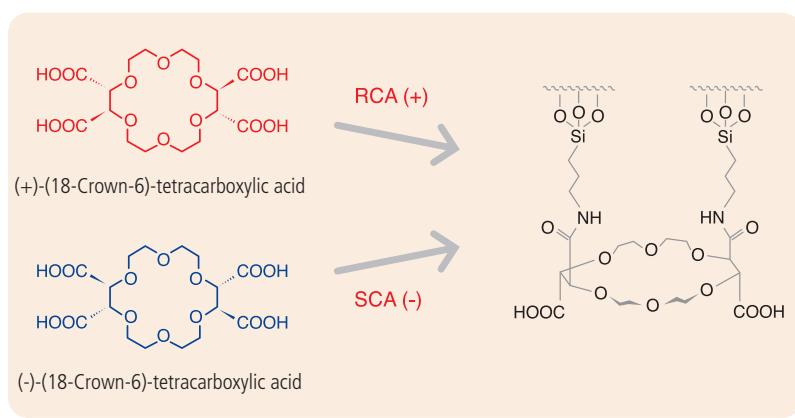

OptimaPak HPLC silica consists of perfectly spherical, totally porous particles, a narrow particle size distribution for high efficiency, low pressure drop and best total economy in chromatographic purifications.

## ● Product List

Phase	Particle size	Pore size	Length xID	Part No.
OptimaPak C18	5 µm	100 Å	150 x 4.6 mm	OP C18-51001546
	5 µm	100 Å	250 x 4.6 mm	OP C18-51002546
	3.5 µm	100 Å	100 x 2.1 mm	OP C18-31001021
	10 µm	100 Å	250 x 10 mm	OP C18-101002510
OptimaPak C8	5 µm	100 Å	150 x 4.6 mm	OP C8-51001546
	5 µm	100 Å	250 x 4.6 mm	OP C8-51002546
	3.5 µm	100 Å	100 x 2.1 mm	OP C8-31001021
	10 µm	100 Å	250 x 10 mm	OP C8-101002510
OptimaPak NH2	5 µm	100 Å	250 x 4.6 mm	OP NH2-51002546
OptimaPak Sil	5 µm	100 Å	250 x 4.6 mm	OP Sil-51002546
	10 µm	100 Å	250 x 10 mm	OP Sil-101002510

ChiroSil® columns are very effective for enantiomer separation of various natural and unnatural  $\alpha$ -amino acids,  $\alpha$ -amino acids, primary amines, amino alcohols ( $\beta$ -blockers) and secondary amines. Other racemic compounds, such as amino alcohols ( $\beta$ -blockers), secondary amines, drugs containing primary amines and secondary amines are also expected to be resolved on ChiroSil® columns.

### The structure of ChiroSil® Stationary phase

#### High selectivity:

- $\alpha$ -Amino Acids
- $\alpha$ -Amino Amides and Esters
- Amines
- Amino Alcohols
- $\beta$ -Blockers
- $\beta$ -Amino Acids
- Aryl  $\alpha$ -Amino Ketones
- Tocainide's Analogues
- Gemifloxacin
- N-(3, 5-dinitrobenzoyl)- $\alpha$ -Amino Acids
- N-(3-dinitrobenzoyl)- $\alpha$ -Amino Acids
- N-benzyl- $\alpha$ -Amino Acids
